- Definition of “Failure”: non-comm for at least 5 consecutive days
- Prediction based on earliest event among:
  - Short failure event, long failure event, selfcheck

How to predict the number of days in between?

- Use following data from EDW
  - Short failure count
  - Long failure count
  - Outage count
  - Negative eventlogs: accumulative count
  - Special events: 1010, 2038, 2116, etc.
  - Voltage
  - Weather & meter temperature
  - Humidity from dewpoint
  - etc.
- Feed these data into machine learning, and predict

- Result:
  - Can predict one week ahead and also the distribution of failed meters.
